## The State of the Child and Family in Erie County:

## Tracking Progress on Key Outcomes and Indicators of Well-Being

## Summary

Through its Blueprint for Change Initiative, Erie County is seeking to make organizational and service delivery improvements that will result in more cost-effective, integrated, and outcomefocused services to children and families. As part of this effort, the County identified the need for objective information about key outcomes and indicators of child and family well-being that could serve as a baseline and be tracked over time. The State of the Child and Family in Erie County was prepared by CGR (Center for Governmental Research Inc.), in partnership with the Erie County Council on Children and Families, to meet this need. This document highlights important demographic changes over the last decade in Erie County and presents trend data on over 40 indicators of child and family well-being. In addition to informing government leaders, policy makers, service providers, and the community as a whole about how the County is doing in achieving desired outcomes, the State of the Child and Family is intended to serve as a tool for planning and a catalyst for bringing about needed improvements.

## Contributing Staff

Susan Lepler and Robert Rosenkrantz directed CGR's team for this project. Kimberly Hood compiled and analyzed state and county data and prepared the profiles and data tables for each of the 44 indicators included in this report. Elizabeth Davis conducted the research and prepared the section describing demographic trends in Erie County.

## Acknowledgements

CGR gratefully acknowledges the assistance of Susan Davidson and Kevin Helfer, Erie County staff to the Council on Children and Families, and all of the members of Council on Children and Families who participated in developing the State of the Cbild and Family. Council members played a major role in selecting the outcomes and indicators for inclusion in this report and reviewing draft documents. Their time, energy, and enthusiasm are appreciated. CGR also acknowledges the University of Buffalo, School of Social Work, Research Center on Children and Youth for its assistance in assessing the availability and quality of local data sources for selected indicators. In addition, CGR thanks Kathleen Goff, Erie County Department of Information and Support Services, for cover design and other graphic assistance.

## TABLE OF CONTENTS

SECTION I: INTRODUCTION ..... 1
SECTION II: DEMOGRAPHIC TRENDS IN ERIE COUNTY, NY ..... 4
SECTION III: OUTCOMES AND INDICATORS ERROR! BOOKMARK NOT DEFINED.
OUTCOME ONE: HEALTHY BIRTHS ..... 15
Indicator 1.1: Early Entry into Prenatal Care ..... 17
Indicator 1.2: Low Birth Weight ..... 18
Indicator 1.3: Pre-Term Births ..... 19
Indicator 1.4: Infant Mortality ..... 20
OUTCOME TWO: CHILDREN GETTING A GOOD START IN SCHOOL ..... 29
Indicator 2.1: Children Receiving Early Intervention Services ..... 24
Indicator 2.2: Preschoolers Receiving Special Education Services ..... 25
Indicator 2.3: Enrollment in State-Funded Prekindergarten Programs ..... 26
Indicator 2.4: Children (K-12) Receiving Special Education Services ..... 25
OUTCOME THREE: CHILDREN SUCCEEDING IN SCHOOL ..... 29
Indicator 3.1: Student Performance on Grade 4 Math and English Language Arts (ELA) Tests ..... 31
Indicator 3.2: Student Performance on Grade 8 Math and English Language Arts (ELA) Tests ..... 32
Indicator 3.3: Attendance Rate - Elementary School ..... 33
Indicator 3.4: Attendance Rate - Middle School ..... 34
Indicator 3.5: Attendance Rate - High School ..... 35
Indicator 3.6: Middle School Suspension Rate ..... 36
Indicator 3.7: High School Drop Out Rate ..... 37
Indicator 3.8: High School Graduates Receiving A Regents Diploma ..... 38
OUTCOME FOUR: HEALTHY CHILDREN AND ADULTS ..... 40
Indicator 4.1: Mortality Rate - Overall ..... 42
Indicator 4.2: Mortality Rate - Lung Cancer ..... 43
Indicator 4.3: Mortality Rate - Heart Disease ..... 44
Indicator 4.4: Mortality Rate - Homicide ..... 45
Indicator 4.5: Mortality Rate - Suicide ..... 46
OUTCOME FIVE: YOUTH MAKING WISE DECISIONS ..... 48
Indicator 5.1: Youth Drug Related Arrests ..... 50
Indicator 5.2: Persons In Need of Supervision (PINS) Case Openings at Probation Intake ..... 51
Indicator 5.3: Juvenile Delinquent (JD) Case Openings at Probation Intake ..... 52
Indicator 5.4: PINS and JDs in Detention Facilities ..... 53
Indicator 5.5: Youth Arrests for DWI ..... 54
Indicator 5.6: Youth Arrests for Part I Violent Crimes ..... 55
Indicator 5.7: Youth Arrests for Part I Property Crimes ..... 56
Indicator 5.8: Youth Morbidity - Gonorrhea ..... 57
Indicator 5.9: Youth Using Alcohol, Drugs, and Other Drugs ..... 58
OUTCOME SIX: NURTURING AND STABLE FAMILIES ..... 60
Indicator 6.1: Reported Cases of Domestic Violence ..... 62
Indicator 6.2: Reported and Indicated Cases of Child Abuse and Neglect ..... 63
Indicator 6.3: Children in Foster Care ..... 64
Indicator 6.4: Children Discharged to Adoption ..... 65
Indicator 6.5: Length of Time to Achieve Adoption ..... 66
Indicator 6.6: Teen Pregnancy Rates, Age 15-19. ..... 67
OUTCOME SEVEN: FAMILIES WITH ADEQUATE INCOME ..... 69

## SECTION I: INTRODUCTION

## Background and Purpose

In 2001, Erie County Executive Joel A. Giambra launched the Blueprint for Change initiative. This initiative seeks to make organizational and service delivery improvements that will result in more cost-effective, integrated, and outcome-focused services to children and families. As part of this effort, the County recognized the need for objective information about key outcomes and indicators of child and family well-being that could serve as a baseline and be tracked over time. This document, the State of the Child and Family in Erie County, responds to the County's need for such a data framework.

The State of the Child and Family in Erie County was prepared by CGR (Center for Governmental Research Inc.), Erie County's consultant for the Blueprint for Change. CGR has worked in partnership with the Erie County Council on Children and Families, a broad-based group of individuals representing County government, the education system, service providers, and local foundations, to develop this document. The State of the Cbild and Family builds on and supports existing efforts to measure progress against desired outcomes including the State of the Region Report and the Community Health Network initiative.

The State of the Cbild and Family has multiple purposes:

* To provide an unbiased assessment of how well Erie County is doing in achieving desired outcomes and an improved quality of life for the County's residents;
* To educate and inform government leaders, policy makers, funders, service providers - as well as the community as a whole - about the status of children and families;
* To be a tool for planning and a catalyst for setting priorities and developing strategies to bring about needed improvements; and
* To stimulate discussion about ways to enhance the availability and quality of data to deepen the understanding of issues and strengthen future editions of the State of the Cbild and Family.

## Process and Methodology

## Defining Terms

To facilitate a common understanding among members of the Council on Children and Families, CGR first defined terms to set the framework for the State of the Cbild and Family. The term outcome was defined as a statement of what we all want for our children, youth, families, and communities. Outcomes typically cross over agency and program lines and public and private sectors.

The term indicator was defined as a measure that helps determine whether progress is being made in achieving the outcome. Because outcomes are broad statements of desired conditions, multiple indicators are needed to paint the picture of whether progress is being made in a particular
outcome area. Indicators should be measurable over time. CGR described two types of indicators: traditional indicators, as measures of problems, at-risk behaviors, and/or dysfunction and promotional indicators, as measures of positive growth, functioning, and development. Although the majority of indicators are of the traditional nature, there is a growing recognition nationally and in New York State of the need to supplement these data with promotional indicators.

## Selecting Outcomes and Indicators

The next step in the process was choosing outcomes and indicators for inclusion in the State of the Cbild and Family. Eight desired outcomes were presented by CGR and then refined and endorsed by the Council ${ }^{1}$.

More than 100 potential indicators were assessed by the Council against three filters: communication power (i.e., how understandable the indicator is to the general public), proxy power (i.e., how well movement on the indicator will positively influence the outcome), and data power (i.e., how available, timely, and reliable data are for the indicator). Indicators that the Council rated highly on each of these dimensions were included on its priority list.

## Erie County State of the Child and Family

Selected Outcomes

- Healthy Births
- Children Getting a Good Start in School
- Children Succeeding in School
- Healthy Children and Adults
- Youth Making Wise Decisions
- Nurturing and Stable Families
- Families with Adequate Income
- Safe and Supportive Communities

CGR then conducted a thorough analysis of data for each of the priority indicators, focusing on: 1) the ability to easily access and analyze the data and 2) the feasibility of collecting and tracking the measure over multiple years. Through this scrutiny, the Council's priority indicator list was divided into two groups: 1) those with established and reliable state level data sources and 2) those without state-level data but potentially having a reliable local data source. CGR contracted with the University at Buffalo, School of Social Work, Research Center on Children and Youth, to assess the availability and quality of data for indicators in this second group.

In the final analysis, CGR determined that a total of 44 indicators had sufficient data to be included in this edition of the State of the Cbild and Family. The remaining indicators, which are largely promotional indicators, are included in a data agenda section under each outcome to highlight the need for additional work on developing reliable and ongoing data sources for these indicators.

## Compiling and Analyzing Data and Presenting Findings

Once the indicator list was finalized, CGR collected and analyzed the best available data from state and local agencies and prepared a one-page profile for each of the indicators included in the State of the Child and Family. Each indicator profile uses a common format that includes: a definition

[^0]of the measure; the significance of the measure; findings over time, including graphs that compare Erie County with the rest of New York State (excluding New York City) and, in some cases, with national goals; and caveats that readers should be aware of when interpreting the data. While these caveats are essential to note, CGR is comfortable that the indicators, individually and collectively, have enough positive attributes and value to offset limitations. When considering a single indicator, it is important to keep in mind that multiple indicators, in combination, may convey a clearer picture of progress or lack thereof for a given outcome.

Graphs and tables present data for the most recent year available and historical data, typically beginning with 1995, for trending purposes. For CGR to suggest that a trend exists, there must be a clear pattern of consistent movement of an indicator in the same direction over several years. Whenever possible, CGR used New York State sources of data rather than Erie County data to enable us to make consistent and reliable comparisons with all counties in the state excluding those in the New York City region. The sources for measures are cited at appropriate places in the report.

CGR's final process for completion of the State of the Child and Family included a review by representatives of the Council on Children and Families and the Erie County Departments of Social Services, Health, Mental Health, Probation and Youth Detention Services.

## Organization of the Report

The State of the Cbild and Family has four sections:
Section I. Introduction. This section describes the background, purpose, and methodology used in developing the State of the Cbild and Family.

Section II. Demographic Trends in Erie County, NY. This section uses data from the U.S. Census Bureau to highlight key changes over the last decade in the City of Buffalo, Rest of County, and the County as a whole. Information presented on total population, age of population, household structure, income, and educational attainment provides an important backdrop for reviewing the findings related to outcomes and indicators.

Section III. Outcomes and Indicators. This is the main section of the document and includes 44 indicator profiles organized by outcome area. At the end of each outcome section, CGR has included a list of indicators that were selected as priority by the members of the Council on Children and Families but for which no reliable data sources are currently available.

Section IV. Appendices. Appendix A includes the data tables for socio-demographic measures. Appendix B includes the data tables for the indicator profiles.

## Section II Demographic Trends <br> in Erie County New York

## Section II: Demographic Trends in Erie County, NY

This section of the State of the Cbild and Family describes the varied and changing face of Erie County. The discussion draws on data from the 1990 and 2000 Census to describe the County's population, ethnic/racial makeup, household types, educational attainment, and income distribution. Unlike the following section on indicator profiles, which compares Erie with the rest of the State (excluding New York City), this demographic overview is meant to give the reader a deeper understanding of the County itself. Particularly, it depicts the County both currently and over the past decade, and it compares the City of Buffalo to the rest of the County or the County as a whole to underscore interesting trends and geographic disparities.

## Highlights

* Erie County's overall population declined during the 1990s due to large decreases in the City of Buffalo, even as the rest of the County's population grew.
* The population of the County is aging, with a particular decline over the past decade in the number of adults aged 18 to 44 .
* There were more single parent families in Erie County in 2000 than in 1990. Although such families are still concentrated in the City of Buffalo, growth in single parent households during the decade was greatest outside the City.
* Although Erie County's population is still primarily white, the County and its suburbs in particular are seeing increases in both African American and Asian populations. The City is still far more racially and ethnically diverse than the rest of the County.
* Educational attainment among adults is on the rise. Although Buffalo residents still lag their counterparts in the rest of the County in high school graduation and other measures of basic education, they have improved substantially over the past decade. Non-City residents, on the other hand, have been increasing their attainment of post-secondary degrees at a higher rate than their urban counterparts.
* Median household and per capita incomes are increasing, although Buffalo residents lag the County average in both total income and income growth.

## Population

Erie County had 950,265 inhabitants in 2000, of whom 328,123 - about a third - resided in the City of Buffalo. As with many urban counties, the traditional core city has been losing population to the suburbs, but in addition, the whole County has lost population despite some growth in the area outside the City. Figure 1 shows the change in total population for the whole County, the City of Buffalo, and the rest of the County.

Figure 1. Change in Population: Total County, City of Buffalo, Rest of County, 19902000

Source: U.S. Census Bureau

## Age of Population

About a quarter of the County's population is under the age of 18. As Table 1 shows, although there has been a slight increase in the number of school-age children over the past decade due to the "baby boom echo," the overall trend has been toward an aging of the population. There are fewer young adults (18 to 24 years) in particular, and the number of adults 25-44 years is also declining. At the same time, the number of adults $45-64$ years is rising. Although the population 65 to 84 has remained fairly steady, there appears to be a trend among this group of moving out of Buffalo and to the suburbs. Finally, the number of people 85 and over has increased by 35 percent overall, and 57 percent outside the City, even though it remains a fairly small portion of the population.

Table 1. Population by Age

|  | 1990 |  |  | 2000 |  |  | Percent Change |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Erie County | City of Buffalo | Rest of County | Erie County | City of Buffalo | Rest of County | Erie County | City of Buffalo | Rest of County |
| Under 5 years | 66,512 | 25,541 | 40,971 | 57,837 | 20,768 | 37,069 | -13.0\% | -18.7\% | -9.5 |
| 5 to 17 years | 158,955 | 53,996 | 104,959 | 172,713 | 56,189 | 116,524 | 8.7 | 4.1 | 11.0 |
| 18 to 24 years | 103,741 | 41,671 | 62,070 | 82,668 | 33,029 | 49,639 | -20.3 | -20.7 | -20.0 |
| 25 to 44 years | 298,564 | 102,979 | 195,585 | 269,666 | 85,891 | 183,775 | -9.7 | -16.6 | -6.0 |
| 45 to 64 years | 193,677 | 55,233 | 138,444 | 216,123 | 57,444 | 158,679 | 11.6 | 4.0 | 14.6 |

| 85 years and over | 13,668 | 5,083 | 8,585 | 18,525 | 5,008 | 13,517 | 35.5 | -1.5 | 57.4 |

[^1]
## Household Types

In 2000, $64 \%$ of Erie County households consisted of families. ${ }^{2}$ Of these, a little over half had no children; about one-third were married couples with children; and 14 percent were single- parent families with children. ${ }^{3}$ As Figure 2 shows, there is a significant difference in the mix of family types between the City of Buffalo and the rest of the County: in Buffalo, 34 percent of families are single parent families, while only 24 percent are married families with children. In the rest of the County, however, only 10 percent of families are single parent families.

Figure 2. Family Composition, City of Buffalo vs. Rest of County, 2000

Source: U.S. Census Bureau

As Figure 3 shows, the County has also seen a rise in single-parent families over the decade. Even though the City of Buffalo still has a far greater percentage of single-parent families than the rest of the County, the majority of the growth (both in terms of total number and percent change) was outside the City. The number of single-parent families grew 10 percent in Buffalo, while the rest of the County had 34 percent growth. In fact, this was the only type of family growth at all - all other types declined, both inside and outside the City.

[^2]Figure 3. Percent Change in Family Types, 1990-2000

## Race/Ethnicity

In 2000, Erie County was $81 \%$ white, but there was a major disparity between the City of Buffalo, which was far more diverse - 51 percent white and 37 percent African American - than the rest of the County, which was quite homogenous, being 95 percent white. (See Figure 4.)

Figure 4. Race / Ethnicity, Buffalo vs. Rest of County, 2000

Rest of County

[^3]Figure 5 shows the change in racial and ethnic makeup of the County over the past decade. The African American, Asian, and Hispanic populations have grown both in the City and the rest of the County, while the County's white population has shrunk overall - declining substantially in the City, while remaining constant in the rest of the County. ${ }^{4}$

Figure 5. Total Change in Population by Major Race /
Ethnicity Groups, Erie County, 1990-2000

Source: U.S. Census Bureau

## Educational Attainment

As Figure 6 shows, most of Erie County's residents aged 25 and over have at least a high school diploma and some college experience, but many still have less than a high school degree. As with many of these demographics, there is a difference between Buffalo and the rest of the County, most strikingly at the low end of the scale: 8 percent of Buffalo's residents aged 25 and over have less than a $9^{\text {th }}$ grade education, double the rate in the rest of the County, and another 17 percent of the City's population attended but never graduated from high school, compared with 10 percent for the rest of the County.

Figure 6. Educational Attainment,
Buffalo vs. Rest of County, 2000

Source: U.S. Census Bureau

[^4]Still, the overall trend during the decade has been an increase in educational attainment, most dramatically at the lowest levels, especially in the City. Figure 7 shows relative educational attainment for the City and the rest of the County in 1990 and 2000. The percentage of people with less than a high school diploma decreased dramatically in the City, while the percentage of those with some college increased. The percent of those outside the City with a bachelor's degree or higher grew noticeably as well.

$\square$ Bachelor's degree or higher

Rest of County, 2000

Source: U.S. Census Bureau

## Income

In 1999, Erie County median household income was $\$ 38,567$, and per capita income was $\$ 20,357$. Buffalo residents' incomes were much lower at $\$ 24,536$ and $\$ 14,991$ respectively. ${ }^{5}$ Figure 8 shows the disparity in the distribution of household incomes between the City and the rest of the County. In 1999, about half of Buffalo residents had incomes under $\$ 25,000$, while fewer than one quarter of non-City residents did. The majority of households with incomes over $\$ 50,000$ resided outside the City.

Figure 8. Household Income Groupings, City of Buffalo vs. Rest of County, 1989 and 1999

Source: U.S. Census Bureau

Figure 8 also shows the changes in income groupings between 1989 and 1999. These data have not been adjusted for inflation, so a direct comparison of the number of people in each category over time does not show the amount of real improvement in incomes. ${ }^{6}$ However, they do show the distribution of growth in income categories between the City and the rest of the County. Although the number of families at the low end has declined and the number at the top end has increased in both cases, these changes have been much more pronounced outside the City of Buffalo than inside it. Families earning under $\$ 25,000$ in the City still far outnumber those earning more, and the number earning between $\$ 25,000$ and $\$ 49,000$ did not change. Outside the City,

[^5]however, families earning $\$ 50,000$ to $\$ 99,999$ bypassed those at the two lower categories as the most common category. The percentage of families outside the City earning over $\$ 100,000$ tripled to over ten percent of the total.

## Poverty

As Figure 9 shows, 15 percent of the County's families with children were living in poverty in 1999, with a large disparity between the poverty rates in the City of Buffalo (34 percent) and the rest of the County ( 6 percent). ${ }^{7}$

Figure 9. Percent of Families with Children under 18 Years
Living Below 100\% of Poverty Level, 1999

Source: U.S. Census Bureau
The disparity in the number of individuals living in households with incomes below 100 percent of the federal poverty level was similar: although 12 percent of individuals lived in poverty in Erie County in 1999, 27 percent of Buffalo residents were living in poverty versus 6 percent of those outside the City. Figure 10 splits the percent of people in poverty into age categories - under 5, 5-$17,18-64$ and 65 and over. As the figure shows, the greatest prevalence of poverty is among children under five, with the second highest prevalence among school-age children. More noticeably, poverty - and especially child poverty - is far higher in the City of Buffalo than in the rest of the County, as is the disparity between child poverty and adult poverty. In 1999, 45 percent of all children in Buffalo under five were living in poverty, compared with 9 percent in the rest of the County.

[^6]Figure 10. Percent of Population Living in Households Below 100\% of Federal Poverty Level, by Age, 1999

Source: U.S. Census Bureau

Poverty rates, age distributions, and geographic disparities have remained fairly stable over the past decade.

## Section III Outcomes \& Indicators

## Outcome One:

## Outcome One: Healthy Births

Indicators:
1.1 Early Entry into Prenatal Care
1.2 Low Birth Weight
1.3 Pre-Term Births
1.4 Infant Mortality

## Indicator 1.1: Early Entry into Prenatal Care

Definition: The number of births occurring to women who initiated prenatal care during the first trimester of pregnancy (before 13 weeks gestation), expressed as a rate per 100 live births.

Significance: Early identification of maternal disease and risks for complications of pregnancy or birth are primary reasons women should enter prenatal care in the first trimester. Early, highquality prenatal care is critical to improving pregnancy outcomes. The Healthy People 2010 target includes increasing the proportion of women entering care during the first trimester to 90 percent.

Source: New York State Department of Health
Findings: Between 1995 and 2000 in Erie County, the proportion of women receiving early prenatal care fluctuated slightly between 74.5 and 76.7 per 100 (between 8,001 and 9,152 of total births occurring annually). Similarly, the NYS excluding NYC region experienced small variations from year-to-year, though on average its rate exceeded Erie County's by 3 percent. Nonetheless, the NYS excluding NYC region and Erie County fell short of the national Healthy People 2010 goal of 90 percent of women entering into prenatal care during the first trimester of pregnancy. Data for this measure are presented in Appendix Table 1.

Caveats: The rate excludes the number of live births for which the date of entry into prenatal care is unknown. In addition to when prenatal care began, it is also important to consider the quality and continuity of care received throughout the pregnancy.

## Indicator 1.2: Low Birth Weight

Definition: The number of live births with birth weight less than 2,500 grams (about 5.5 pounds), as expressed as a rate per 100 births.

Significance: Low birth weight is a leading cause of neonatal death. Reductions in the number of low birth weight infants can lead to significant reductions in the infant mortality rate. Low birth weight infants are more likely than normal birth weight infants to experience long-term developmental and neurological disabilities. The Centers for Disease Control and Prevention report that maternal smoking is the cause of 20 to 30 percent of all low birth weight births in the United States. The Healthy People 2010 target is a reduction in the proportion of low birth weight infants to no more than 5 percent.

Findings: Low birth weight rates in Erie County remained fairly constant during the latter half of the 1990s, with annual rates ranging from 7.5 to 8.6 per 100 (representing between 878 and 963 infants annually) between 1995 and 2000. While the NYS excluding NYC rate has experienced a slow but steady increase, it remains, on average, a percentage point below the County rate. The low birth weight rate for both Erie County and the NYS excluding NYC region as a whole exceeded the Healthy People 2010 goal of no more than 5 low birth weight births per 100 live births. Data for this measure are presented in Appendix Table 2.

Caveats: None.

## Indicator 1.3: Pre-Term Births

Definition: The number of pre-term births (gestation less than 37 weeks), expressed as a rate per 100 live births.

Significance: The Centers for Disease Control and Prevention report that pre-term birth is a leading causing of neonatal death. The majority of low birth weight infants are born pre-term. Preterm birth is associated with risk factors such as alcohol, tobacco, and drug use during pregnancy, and low weight gain during pregnancy. Nationally, pre-term births have been increasing, due largely to multiple births. The Healthy People 2010 target is no more than 7.6 pre-term births per 100 live births.

Source: New York State Department of Health (1995-1999), Erie County Department of Health (2000)
Findings: Pre-term birth rates in Erie County have slowly but steadily increased since 1995. By 2000, there were 1,309 pre-term births in the County, or about one in eight live births compared to 1,208 pre-term births in 1995 (one in ten live births). Throughout the latter half of the 1990s, both Erie County and NYS excluding NYC pre-term birth rates exceeded the Healthy People 2010 goal, with Erie County's rate slightly higher (worse) than the larger comparison area's rate throughout that period. These data are presented in Appendix Table 3.

Caveats: The rate excludes births for which the gestational age is unknown.

## Indicator 1.4: Infant Mortality

Definition: The number of deaths of infants less than one year old, expressed as a rate per 1,000 live births in a population.

Significance: The infant mortality rate is an indicator of the overall health and well being of a population. Birth defects, pregnancy complications, and factors associated with preterm births and low birth weight are leading causes of neonatal death (death in the first 28 days of life). The majority of deaths occurring during the postneonatal period (between age 29 days to one year) are likely preventable (e.g., SIDS, injuries, homicides). Nationally, the infant mortality rate among African Americans is more than twice the rate among whites, and higher rates are also correlated with young maternal age and low birth weight. The Healthy People 2010 target is no more than 4.5 infant deaths per 1,000 live births.

Source: New York State Department of Health
Findings: Since 1995, the infant mortality rate in Erie County has been above the rate for the NYS excluding NYC region as a whole. The number of infant deaths in Erie County rose from 85 , or 6.9 per 1,000 in 1995 to 106 , or 8.8 per 1,000 in 1996 (the six year high), but has steadily declined since then to 84 deaths in 2000. Nonetheless, both the Erie County and the comparison region consistently exceeded (i.e., were worse than) the Healthy People 2010 goal of 4.5 infant deaths per 1,000 live births. Data are presented in Appendix Table 4.

Caveats: None.

## Data Agenda

While the Council on Children and Families identified the following indicators for inclusion in this baseline report under the outcome of Healthy Births, CGR determined that reliable and consistent local trend data are currently unavailable.

Children Exposed to Alcohol, Tobacco, STDs and HIV in Utero
Women Receiving Continuous and Adequate Prenatal Care

## Outcome Two:

> CHILDREN
> GETTING A GOOD START IN SCHOOL

## Outcome Two: Children Getting A Good Start In School

## Indicators:

### 2.1 Children Receiving Early Intervention Services

2.2 Preschoolers Receiving Special Education Services
2.3 Enrollment in State-Funded Prekindergarten Programs
2.4 Children (K-12) Receiving Special Education Services ${ }^{1}$

[^7]
## Indicator 2.1: Children Receiving Early Intervention Services

Definition: The number of children, ages birth through two, receiving Early Intervention (EI) services, such as physical therapy, occupation therapy, and speech therapy in a variety of settings, on December 1 of each year, expressed as a rate per 100 children ages 0-2.

Significance: Early Intervention services are likely to reduce the duration and severity of developmental delays experienced by infants and toddlers (including cognitive, physical, communication, social/emotional, or adaptive delays). As such, the early identification of developmental delays and subsequent participation in the Early Intervention program may lead to reductions in the number of preschool and school-aged children needing special education services.

Source: New York State Department of Health (1994-1998), Erie County Department of Health (1999-2001)
Findings: From 1994 to 1998, the proportion of children in Erie County receiving Early Intervention services on December 1 more than doubled. Additional data for the years 1999 through 2001, provided by the Erie County Department of Health, indicate a continuation of this trend, with the proportion of children receiving services nearly quadrupling between 1994 and 2001. By 2001, 1,221 children less than three years of age, or about $3.6 \%$ of this age group, were receiving Early Intervention services. From 1994 to 1998, for the most part, the NYS excluding NYC region rate and trend were comparable to Erie County's. Subsequent data for the larger region are not yet available. Data for this indicator, including referrals to the Early Intervention program, are presented in Appendix Tables 5A and 5B.

Caveats: The most current data available for the NYS excluding NYC region are 1998.

## Indicator 2.2: Preschoolers Receiving Special Education Services

Definition: The number of preschool age children with disabilities, ages three through five, receiving special education services on December 1 of the given year, as authorized by a school district's Committee on Preschool Special Education. This measure is expressed as a rate per 1,000 children ages 3-5.

Significance: Preschool special education services can improve children's cognitive performance, reduce the need for special education services in grades K-12, and increase the likelihood of success in school.

Findings: Between 1996 and 2000, the number of Erie County's preschoolers receiving special education services declined by $9.7 \%$, from 1,628 to 1,470 children. In 2000 (the most recent year for which data are available), about $4 \%$ of the County's three to five olds received special education services. Appendix Table 6 provides a breakdown of the data by the school districts within Erie County. Comparable county level data prior to 1996 and comparable NYS excluding NYC data were not readily available for this indicator.

Caveats: Classification rates may vary between schools due to differing standards being applied by the various Committees on Preschool Special Education. Parents' roles, particularly the extent to which a parent may push for his or her child to be classified, and the district's responsiveness to the parent may also impact rates.

## Indicator 2.3: Enrollment in State-Funded Prekindergarten Programs

Definition: The number of children enrolled in state-funded prekindergarten programs (experimental prekindergarten and universal prekindergarten), expressed as a rate per 1,000 population of four year olds. While three year olds are eligible for participation in this program, according to the New York State Education Department, the vast majority of students in prekindergarten programs are four years old. Therefore our rate calculation is per 1,000 four year olds. To the extent that some three year olds are enrolled in prekindergarten programs, our rate may overstate the actual enrollment of four year olds in the program.

Significance: Quality preschool programs provide young children placed at risk by their social and economic circumstances with experiences that enhance their readiness to learn.

Findings: Since the 1998-99 school year, enrollment in state-funded prekindergarten programs increased $52 \%$ in Erie County. During the 2001 - 2002 school year, more than 3,500, or about $29 \%$ of Erie County's four year olds were enrolled in state-funded prekindgarten programs. The NYS excluding NYC region's upward trend in enrollment mirrors Erie County's, although a higher proportion of Erie County's four year olds are enrolled. Data for this measure, broken out by school district, are provided in Appendix Table 7.

Caveats: Ideally, these data should be combined with data on the numbers of children in accredited child care facilities and children enrolled in Head Start in order to provide a better picture of opportunities available to enhance children's readiness to learn. CGR was able to obtain data pertaining to the capacity of accredited facilities in Erie County, however these data were not available by age category, and thus, were not directly comparable to the data presented above. Similarly, historical Head Start data were not available, though data for 2000 reveal that 2,092 children age zero to five and their families were provided Head Start services.

## Indicator 2.4: Children (K-12) Receiving Special Education Services

Definition: The number of school-age students with disabilities receiving special education services on December 1 of the given year, and who were the responsibility of a school district's Committee on Special Education. The special education classification rate represents the number of students with disabilities, expressed as a percentage of the total school district enrollment. These data include students who were provided special education services by school district operated programs, other district programs, BOCES, approved private schools, Special Act School Districts, and state-operated and state-supported schools.

Significance: Students receiving special education services in grades K-12 may be at greater risk for poor school performance, including poorer performance on standardized tests, a higher likelihood of dropping out, and a lower likelihood of graduating with a Regents diploma and participating in postsecondary education when compared to their peers in general education.

Number of Students Receiving Special Education Services - Erie County

Source: New York State Education Department

Source: New York State Education Department

Findings: Between 1996 and 2000, both the number and proportion of K-12 students receiving special education services in Erie County increased. In 2000 (the most recent year for which data are available), 20,986 students countywide were receiving special education services ( $12.9 \%$ more compared to 1996). The proportion of students receiving special education services also increased from $10.8 \%$ in 1996 to $12.3 \%$ in 2000 . Data for this measure, broken out by school district, are provided in Appendix Table 8.

Caveats: Classification rates may vary between schools due to differing standards being applied by the various Committees on Special Education. Parents' roles, particularly the extent to which a parent may push for his or her child to be classified, and the district's responsiveness to the parent may also impact rates. Comparable county level data prior to 1996 were not available. Data on the number of K-3 students receiving special education services would allow for a better assessment of the impact of children's participation in early childhood programs such as Early Intervention, Preschool Special Education, and Prekindergarten programs. Currently, only aggregate K-12 data are available.

## Data Agenda

While the Council on Children and Families identified the following indicators for inclusion in this baseline report under the outcome of Children Getting a Good Start in School, CGR determined that reliable and consistent local trend data are currently unavailable.

Children Entering Kindergarten with Age-Appropriate Physical/Motor, Cognitive, Language, and Social Emotional Development

Children Ready for First Grade as Measured by Kindergarten Teachers' Skills Test
Children Read to Daily by an Adult

## Outcome Three:

## CHildren <br> Succeeding IN SCHOOL

## Outcome Three: Children Succeeding In School

## Indicators:

### 3.1 Student Performance on Grade 4 Math and English Language Arts Tests

3.2 Student Performance on Grade 8 Math and English Language Arts Tests
3.3 Attendance Rate - Elementary School (K-3 and 4-6)
3.4 Attendance Rate - Middle School (7-8)
3.5 Attendance Rate - High School (9-12)
3.6 Middle School Suspension Rate
3.7 High School Drop Out Rate
3.8 High School Graduates Receiving a Regents Diploma

## Indicator 3.1: Student Performance on Grade 4 Math and English Language Arts (ELA) Tests

Definition: Data for this measure reflect the proportion of Grade 4 students scoring at each of the four levels as measured by the English Language Arts and Mathematics tests. Each level of scores represents a level of mastery of content and skills. At Level 4, test scores indicate student performance exceeds the standards and the student is moving toward high performance on the Regents exam. At Level 3, test scores indicate student performance at least meets the standards, and with continued steady growth, the student should pass the Regents exam. At Level 2, test scores indicate that the student will need extra help to meet the standards and pass the Regents exam. At Level 1, test scores indicate that the student has serious academic deficiencies. This student needs the most help to meet the standards. The desired level of performance is level 3 or higher.

Significance: The revised graduation requirements demand that all students strive to succeed at the Regents or higher levels. Grade 4 Math and ELA tests are early markers of students' likely success on Regents examinations.

Findings: Since 1999, a larger percentage of Erie County's $4^{\text {th }}$ graders have met state standards in Math than in English Language Arts. In 2001, countywide, $76 \%$ of $4^{\text {th }}$ graders tested in Math scored at level 3 or 4 , with the proportion scoring at level 4 the highest since the test was first administered in 1999. In 2002, countywide, the proportion of $4^{\text {th }}$ graders scoring at levels 3 and 4 declined to $72 \%$. The proportion of students scoring at the lowest level, level 1, has remained virtually unchanged since 1999. The proportion of students scoring at the highest level for ELA increased from $5 \%$ in 1999 to $21 \%$ in 2002, with $63 \%$ of students meeting standards (level 3 or 4 ) in 2002. Since 1999, the proportion of students scoring at level 1 remained fairly constant, averaging about $8 \%$. See Appendix Tables 9 and 10 for district data.

Caveats: Public schools began using this test in the 1998-1999 school year.

## Indicator 3.2: Student Performance on Grade 8 Math and English Language Arts (ELA) Tests

Definition: Data for this measure reflect the proportion of Grade 8 students scoring at each of the four levels as measured by the English Language Arts and Mathematics tests. Each level of scores represents a level of mastery of content and skills. At Level 4, test scores indicate student performance exceeds the standards and the student is moving toward high performance on the Regents exam. At Level 3, test scores indicate student performance at least meets the standards, and with continued steady growth, the student should pass the Regents exam. At Level 2, test scores indicate that the student will need extra help to meet the standards and pass the Regents exam. At Level 1, test scores indicate that the student has serious academic deficiencies. This student needs the most help to meet the standards. The desired level of performance is level 3 or higher.

Significance: The revised graduation requirements demand that all students strive to succeed at the Regents or higher levels. Grade 8 Math and ELA tests are markers of students' likely success on Regents examinations.

Findings: Countywide, in 2001, one in five $8^{\text {th }}$ graders demonstrated serious academic deficiencies in mathematical skills and knowledge expected at their grade level (level 1). In each year between 1999 and 2001, between $51 \%$ and $54 \%$ of $8^{\text {th }}$ graders tested did not meet minimum standards for demonstrating proficiency in mathematics (level 1 or 2). In 2002, scores improved somewhat, with $46 \%$ of students not meeting standards, and fewer students ( $14 \%$ ) scoring at level 1. In English Language Arts, $8^{\text {th }}$ graders scoring at level 4 increased slightly from 8\% in 1999 and 2000 to $10 \%$ in 2001 and 2002. However, during the same period, the proportion of students meeting standards in ELA (scoring at levels 3 and 4) declined from $52 \%$ in 1999 to $48 \%$ in 2002. District level data are presented in Appendix Tables 11 and 12.

Caveats: Public schools began using this test in the 1998-1999 school year.

## Indicator 3.3: Attendance Rate - Elementary School

Definition: Attendance rates, expressed as a percent, reflect the actual average daily attendance divided by possible average daily attendance for students in grades K-3 and 4-6 in public school districts.

Significance: Absenteeism can have serious negative long-term consequences for youth. Youth who experience frequent absences from school are at higher risk of failing or dropping out of school, exhibiting delinquent behavior, and engaging in substance abuse and other risky behaviors. Attendance, suspension, and dropout rates serve as useful measures of schools' abilities to motivate and retain students.

Source: New York State Education Department

Source: New York State Education Department

Findings: Elementary school attendance rates in Erie County remained fairly stable from year to year between the 1995-96 and 2000-01 school years, with rates among grades K-3 typically about a half of a percentage point lower than rates among grades 4-6. Erie County's attendance rates for both K-3 and 4-6 grades have been comparable to the NYS excluding NYC region's rates. Data for this measure, including district-level breakdowns for Erie County, are presented in Appendix Tables 13A and 13B.

Caveats: Data are for public school districts only. This measure shows overall attendance rates and does not address the degree to which individual students exhibit attendance problems.

## Indicator 3.4: Attendance Rate - Middle School

Definition: Attendance rates, expressed as a percent, reflect the actual average daily attendance divided by possible average daily attendance for students in grades 7-8 in public school districts.

Significance: Absenteeism can have serious negative long-term consequences for youth. Youth who experience frequent absences from school are at higher risk of failing or dropping out of school, exhibiting delinquent behavior, and engaging in substance abuse and other risky behaviors. Attendance, suspension, and dropout rates serve as useful measures of schools' abilities to motivate and retain students.

Source: New York State Education Department
Findings: After decreasing between the 1995-96 and 1998-99 school years, middle school attendance rates in Erie County have slowly but steadily increased from 93.9\% in 1998-99 to $94.7 \%$ in 2000-01. Between the 1995-96 and 1999-00 school years, middle school attendance rates for the NYS excluding NYC region were typically slightly (no more than half a percentage point) higher or better than Erie County's rates. Rates in both the County and the larger region were comparable during the 2000-01 school year. Data for this measure, including district-level breakdowns for Erie County, are presented in Appendix Tables 13A and 13B.

Caveats: Data are for public school districts only. This measure shows overall attendance rates and does not measure the degree to which individual students exhibit attendance problems.

## Indicator 3.5: Attendance Rate - High School

Definition: Attendance rates, expressed as a percent, reflect the actual average daily attendance divided by possible average daily attendance for students in grades 9-12 in public school districts.

Significance: Absenteeism can have serious negative long-term consequences for youth. Youth who experience frequent absences from school are at higher risk of school failure, dropping out of school, exhibiting delinquent behavior, substance abuse, and engaging in other risky behaviors. Attendance, suspension, and dropout rates serve as useful measures of schools' abilities to motivate and retain students.

Source: New York State Education Department
Findings: High schools (grades 9-12) have had the lowest attendance rates of any grade levels within Erie County. Countywide attendance rates for grades $9-12$ reached their lowest point during the six year study period in the 1999-00 school year ( $91.3 \%$ ), but rebounded to their highest level of $92.4 \%$ the following year. Further data are needed to determine whether this increase represents a significant trend. During the six-year period described here, NYS excluding NYC rates were consistently higher (i.e., better) than Erie's rates by about a percentage point on average. Data for this measure, including district-level breakdowns for Erie County, are presented in Appendix Tables 13A and 13B.

Caveats: Data are for public school districts only. This measure shows overall attendance rates and does not measure the degree to which individual students exhibit attendance problems.

## Indicator 3.6: Middle School Suspension Rate

Definition: Suspension from school is a form of discipline imposed for serious or repeated infractions of school rules. This indicator is expressed as a rate per 100 students. It is obtained by dividing the number of middle/junior high school students who were suspended from school for at least one full day by the total middle/junior high school enrollment. Data pertain to out-ofschool suspensions only, and include both short-term and long-term suspensions.

Significance: Students who are suspended from school are more likely to exhibit risk behaviors and are at greater risk for poor performance in school compared to their classmates.

> Source: New York State Education Department

Findings: Between the 1995-96 and 2000-01 school years, Erie County's middle school suspension rate has varied from $3.1 \%$ to $4.1 \%$. A slight downward trend in the countywide suspension rate began in 1998-99, and by 2000-01, about $19 \%$ fewer students were suspended than had been three years earlier (727 vs. 901). NYS excluding NYC's middle school suspension rate has consistently been about twice the County's rate. Suspension data are provided in Appendix Table 14.

Caveats: Suspension rates may vary among schools due to differing disciplinary policies and enforcement of those policies, so lower rates do not necessarily reflect better student performance or compliance. This measure includes only public school data for middle/junior high school students. Separate information on the number of short- and long-term suspensions is not available from the State Education Department.

## Indicator 3.7: High School Drop Out Rate

Definition: Any pupil who leaves school prior to graduation, for any reason except death, and who does not enter another school or a program leading to a general equivalency diploma (GED). The rate, measured as a percent, is derived from the number of public school dropouts during the school year, divided by grade $9-12$ enrollment.

Significance: Youth who drop out of high school face the likelihood of reduced employment opportunities and earnings potential, and may be at greater risk for needing public assistance. Females who drop out of high school are at greater risk of becoming teen mothers.

Source: New York State Education Department
Findings: Between the 1994-95 and 2000-01 school years, the number of Erie County youth who dropped out of high school declined by $37.5 \%$ (1,108 in 1994-95 compared to 692 in 2000-01). While Erie County's rates decreased during the seven-year period, drop out rates for NYS excluding NYC remained relatively constant, and since the 1997-98 school year, the comparison region's rate has been above (worse than) the County's rate. Data are presented in Appendix Table 15.

Caveats: These data are for public schools only. In addition, a more comprehensive measure would be to follow a cohort of students entering $9^{\text {th }}$ grade and determine the percentage of students who graduate. This information cannot now be consistently obtained from all school districts.

## Indicator 3.8: High School Graduates Receiving A Regents Diploma

Definition: The number of students (general education and special education combined) who earned a Regents endorsed local diploma during the school year, expressed as a rate per 100 local diplomas earned.

Significance: Regents requirements ensure that all students graduate from high school with the skills and knowledge to find employment and pursue higher education. In addition, beginning with the class entering 9th grade in 2001, all general-education students will be required to demonstrate competency for graduation in all areas using Regents examinations (measured by a score of 65 or higher on Regents examinations).

CGR
High School Graduates Receiving Regents Diplomas

Source: New York State Education Department
Findings: The proportion of Regents diplomas earned in Erie County steadily increased between the 1995-96 and 2000-01 school years. By the 2000-01 school year, the number of students earning a Regents diploma was about $42 \%$ higher than in 1995-96 (4,980 vs. 3,500). After having been relatively comparable for five years, in the 2000-01 school year, Erie County's rate exceeded the larger comparison area's rate. It is too soon to determine whether this represents a significant trend. Data are presented in Appendix Table 16.

Caveats: Data are for public schools only.

## Data Agenda

While the Council on Children and Families identified the following indicators for inclusion in this baseline report under the outcome of Children Succeeding in School, CGR determined that reliable and consistent local trend data are currently unavailable.

Number of Developmental Assets Reported by Youth ${ }^{1}$
Parents/Adults Engaged in Children's Learning and Education
Students Participating in Extracurricular Activities

[^8]Outcome Four:

## Outcome Four: Healthy Children and Adults

## Indicators:

4.1 Mortality Rate - Overall
4.2 Mortality Rate - Lung Cancer
4.3 Mortality Rate - Heart Disease
4.4 Mortality Rate - Homicide
4.5 Mortality Rate - Suicide

## Indicator 4.1: Mortality Rate - Overall

Definition: Number of deaths per 100,000 residents of all ages.
Significance: The mortality rate is a significant indicator of the overall health of a region. The measures that follow detail trends for specific causes of death, some of which researchers believe could be reduced through prevention efforts, early detection, and treatment.

Source: NYS DOH - County Health Indicator Profiles
Findings: Overall mortality rates steadily declined in Erie County between 1995 and 1999 before increasing again in 2000. County rates have been substantially higher (on average, about 150 more deaths per 100,000 population) than rates in the comparison area during the same period. Detailed trends in rates of death by specific causes (lung cancer, breast cancer, cerebrovascular disease, diseases of the heart, homicide, suicide, unintentional injury, AIDS and cirrhosis) are listed in Appendix Table 17. Several of these are graphed and discussed in the following pages.

Caveats: These mortality rates are for the total population and have not been adjusted for age and gender differences in the population.

## Indicator 4.2: Mortality Rate - Lung Cancer

Definition: Number of deaths from lung cancer per 100,000 residents of all ages.
Significance: Among males and females in the United States, lung cancer is the most common cause of cancer death. Cigarette smoking is the most significant risk factor for lung cancer. The Centers for Disease Control and Prevention estimate that cancer rates overall could be reduced by as much as half through smoking cessation and improved dietary habits. The Healthy People 2010 target for the nation is 44.9 lung cancer deaths per 100,000 population.

Findings: Mortality rates due to lung cancer have increased slightly in Erie County since 1995, while rates have remained relatively stable in the NYS excluding NYC region during the same time period. Erie County's lung cancer mortality rate has been consistently higher than that of the larger region as a whole. Erie County's lung cancer mortality rates ranged between 68.4 and 75.2 deaths per 100,000 during the study period. Data are presented in Appendix Table 17B.

Caveats: These mortality rates are for the total population and have not been adjusted for age and gender differences in the population.

## Indicator 4.3: Mortality Rate - Heart Disease

Definition: Number of deaths from heart disease per 100,000 residents of all ages.
Significance: In the United States, heart disease is the leading cause of death for all people. The Centers for Disease Control and Prevention report that in the United States, one out of every two males, and one out of three females, will develop coronary heart disease in his or her lifetime. Primary prevention efforts and screening for risk factors can play significant roles in reducing the incidence of heart disease. The Healthy People 2010 target for the nation is 166 coronary heart disease deaths per 100,000 population.

Findings: Erie County's heart disease mortality rate has steadily declined from 377.9 deaths per 100,000 population in 1995 to 342.6 deaths per 100,000 population in 2000 . While the larger comparison area experienced similar trends, its rate has consistently been below (better than) that of the County. Data are presented in Appendix Table 17C.

Caveats: These mortality rates are for the total population and have not been adjusted for age and gender differences in the population.

## Indicator 4.4: Mortality Rate - Homicide

Definition: Number of deaths from homicide per 100,000 residents of all ages.
Significance: The Centers for Disease Control and Prevention report that while homicide rates overall are declining throughout the country, for young persons between ages $15-24$ years, homicide remains the second leading cause of death. For young African American males, homicide is the leading cause of death. Overall, males are more likely to be victims of homicide than females. The Healthy People 2010 overall target is no more than 3 homicides per 100,000 population.

Source: New York State Department of Health - County Health Indicator Profiles
Findings: From 1995 to 1999 Erie County's death rate due to homicide dropped by $55 \%$. While rates increased in 2000, it is too soon to determine whether this increase represents a significant trend. The rate reductions that occurred throughout much of the study period have resulted in a lessening of the gap between Erie County's and the comparison region's rates. In 1995, Erie County's rate of death from homicide was nearly twice that of the rate for the NYS excluding NYC region. While Erie County's rate remained above the region's rate during the entire six-year study period, the difference has been greatly reduced. Data are presented in Appendix Table 17D.

Caveats: These mortality rates are for the total population and have not been adjusted for age and gender differences in the population.

## Indicator 4.5: Mortality Rate - Suicide

Definition: Number of deaths from suicide per 100,000 residents of all ages.
Significance: Mental health and substance abuse disorders are significant risk factors for suicide. While there are other factors that contribute to suicide, in many cases, the early recognition and treatment of mental health and substance abuse problems may prevent suicide. Nationally, suicide is the $3^{\text {rd }}$ leading cause of death for adolescents, and there has been a greater increase in suicide among adolescents compared to the general population. The Healthy People 2010 target is no more than 5 suicides per 100,000 population.

Source: New York State Department of Health - County Health Indicator Profiles
Findings: Suicide rates have been relatively stable over time, ranging between 7.3 and 9.4 per 100,000 annually ( 72 and 92 deaths, respectively). With the exception of 1995 and 1998, Erie County's rate has been comparable to the NYS excluding NYC region's rate. Data are presented in Appendix Table 17E.

Caveats: These mortality rates are for the total population and have not been adjusted for age and gender differences in the population.

## Data Agenda

While the Council on Children and Families identified the following indicators for inclusion in this baseline report under the outcome of Healthy Children and Adults, CGR determined that reliable and consistent local trend data are currently unavailable.

Children with Serious Emotional Disturbances Receiving Mental Health Services
Per Capita Health Care Costs
Adults and Youth Reporting Regular Exercise
Adults Experiencing Depression or Anxiety
Youth Experiencing Depression or Anxiety
Individuals Receiving Routine Check-ups
Smoking Prevalence ${ }^{1}$
Substance Abuse Prevalence ${ }^{2}$
Access to Health Care/Health Insurance Coverage ${ }^{3}$

[^9]
## Outcome Five:

## MAKing Wise DECISIONS

## Outcome Five: Youth Making Wise Decisions

## Indicators:

### 5.1 Youth Drug Related Arrests

5.2 Persons in Need of Supervision (PINS) Case Openings at Probation Intake
5.3 Juvenile Delinquent (JD) Case Openings at Probation Intake
5.4 PINS and JDs in Detention Facilities
5.5 Youth Arrests for DWI
5.6 Youth Arrests for Part I Violent Crimes
5.7 Youth Arrests for Part I Property Crimes
5.8 Youth Morbidity - Gonorrhea
5.9 Youth Engaging in Risk Behaviors

## Indicator 5.1: Youth Drug Related Arrests

Definition: The number of arrests of youth, ages 0-17, for drug related offenses, expressed as a rate per 10,000 youth.

Significance: Drug use and other drug related activity by adolescents can have immediate as well as long term negative health, social, and economic consequences.

Source: New York State Division of Criminal Justice Services, Uniform Crime Reporting System
Findings: After peaking in 1996 (644 arrests), the number of youth drug arrests decreased by approximately $19 \%$ in 1998 ( 524 arrests) before experiencing another increase in 1999 (544 arrests). In 2000, the number and rate of youth drug arrests (542 and 23.2, respectively) were comparable to the prior year's data. Erie County and NYS excluding NYC rates were comparable from 1995 to 1997, but since 1998, Erie County's rate has been below (better than) the NYS excluding NYC rate. Additionally, between 1995 and 2000, youth arrests represented between 11 and $12 \%$ of all drug related arrests in Erie County annually; in the larger comparison region they represented 13 to $14 \%$ of total annual drug related arrests. Data are presented in Appendix Table 18.

Caveats: Arrest rates may be affected by increased or decreased surveillance by law enforcement agencies, or they may reflect actual increases or decreases in the prevalence of drug sales or use. Some individuals may be arrested more than once during a single year, so the arrest rates presented here may overstate the actual number of individuals arrested. Arrests are recorded where they occur, and do not necessarily reflect the individual's residence.

## Indicator 5.2: Persons In Need of Supervision (PINS) Case Openings at Probation Intake

Definition: This measure reflects the annual rate of PINS case openings at individual county Probation Departments. A PINS is defined as a juvenile less than 16 years of age (as of July 1, 2002, less than 18 years of age) for whom complaints were filed with the local Probation Department because of non-criminal misconduct such as not attending school regularly, incorrigibility, being ungovernable, or habitually disobedient and beyond lawful control of a parent or other guardian. PINS rates reflect the number of cases opened as a rate per 1,000 youth age $10-15$; youth less than 10 years of age are excluded from rate calculations due to the low number of complaints filed for this age category.

Significance: PINS cases are opened for non-criminal misconduct perceived as serious enough by the parent, agency, or school filing the PINS petition to seek the formal intervention of Family Court to try to control the behavior. A potential outcome of a PINS adjudication is a costly and disruptive out-of-home placement.

CGR
PINS Cases Opened at Probation Intake

Findings: The number of PINS cases opened in Erie County rose sharply between 1995 and 1996, (1,155 openings vs. 2,057 openings), then, after leveling off between 1996 and 1999, declined by approximately $24 \%$ between 1999 and 2001. However, the County still experienced a higher rate of case openings in 2001 than it had in 1995 ( 1,454 cases or 17.9 per 1,000 compared to 1,155 or 15.8 per 1,000 ). Since 1996 , Erie County's rate of PINS case openings has remained above the comparison region's rate, although in recent years the gap between the two has narrowed substantially. See Appendix Table 19.

Caveats: These data do not reflect an unduplicated count of cases opened at Probation Intake; an individual may have multiple PINS petitions filed within a single year. Also, it is important to note that these data do not reflect the ultimate disposition of the case. Finally, since 2001 county population estimates by age are not yet available, 2001 rate calculations are based on Census 2000 population data.

## Indicator 5.3: Juvenile Delinquent (JD) Case Openings at Probation Intake

Definition: This measure reflects the rate of Juvenile Delinquent (JD) case openings at county Probation Departments in a given year, expressed as a rate per 1,000 youth age $10-15$; youth less than 10 years of age are excluded due to the low number of JD case openings filed for this lower age category. A JD is a person over 7 and less than 16 years of age who is found by the Family Court to have committed an act that, if committed by an adult, would constitute a crime.

Significance: Individuals who commit crimes in their youth are more likely to commit other offenses later in life.

Findings: Following a $63 \%$ increase in the number of JD cases opened at intake between 1995 and 1996 from 912 to 1,489, Erie County's case openings have steadily declined. In 2001, 1,165 JD cases were opened for service in Erie County, about 22\% fewer than in 1996. During the seven-year period from 1995 - 2001, the NYS excluding NYC region also saw a steady reduction ( $33 \%$ overall) in its JD case openings. While the County has typically been below the NYS excluding NYC rate, in recent years that gap has narrowed, and in 2001, the two rates were comparable. Data are presented in Appendix Table 20.

Caveats: These data do not reflect an unduplicated count of cases opened at Probation Intake; an individual may have multiple case openings within a single year. Also, it is important to note that these data do not reflect the ultimate disposition of the case. Finally, since 2001 county population estimates by age are not yet available, 2001 rate calculations are based on Census 2000 population data.

## Indicator 5.4: PINS and JDs in Detention Facilities

Definition: The number of youth placed in secure and non-secure detention facilities either through the Person In Need of Supervision (PINS) or Juvenile Delinquent (JD) process. PINS youth are placed in non-secure facilities while JDs are typically placed in secure detention facilities.

Significance: Placement in detention facilities may be viewed as a precursor of a youth's deeper involvement in the juvenile or adult justice system.

* Secure admission closed by OCFS during a portion of 2001.

Source: Erie County Probation Department - Youth Detention

Findings: The number of youth in non-secure detention in Erie County increased 44\%, from 731 to 1,050, between 1995 and 2001. Juvenile Delinquents in secure detention increased $33 \%$, from 471 to 625, during the same period. These data are presented in Appendix Table 21.

Caveats: Changes over time could reflect changes in the availability of secure and non-secure detention beds. Comparable data for the NYS excluding NYC region are not available.

## Indicator 5.5: Youth Arrests for DWI

Definition: Arrest rates for driving while intoxicated (DWI), expressed as a rate per 10,000 population under age 18 .

Significance: Alcohol impairs both cognitive and physiological functions. Individuals who drink and drive put themselves and others at greater risk of accidents, injury, and death. Property damage, injuries, and death caused by alcohol-related motor vehicle accidents are all preventable through the reduction in drinking and driving.

Source: New York State Division of Criminal Justice Services, Uniform Crime Reporting System
Findings: In 1999, there were $45 \%$ fewer youth arrests for DWI in Erie County than in 1995. However, between 1999 and 2000, the number of youth DWI arrests doubled from 16 to 32 . Additional data are necessary to determine whether this single year increase represents the beginning of an upward trend. Throughout the six-year period, Erie County's youth arrest rates have consistently been below the NYS excluding NYC rate, though the gap between the two narrowed substantially in 2000. In both the County and the comparison region, youth DWI arrests consistently represent less than about $1 \%$ of total DWI arrests. Arrest data are presented in Appendix Table 22.

Caveats: Arrest rates may be affected by increased or decreased surveillance by law enforcement agencies, or they may reflect actual increases or decreases in the prevalence of drunk driving. Data reflect the number of arrests, and some individuals may be arrested more than once during a single year, so the arrest rates presented here may overstate the actual number of individuals arrested. Arrests are recorded where they occur, and do not necessarily reflect the individual's residence.

## Indicator 5.6: Youth Arrests for Part I Violent Crimes

Definition: The number of arrests of youth, ages $10-17$, for Part I crimes, expressed as a rate per 1,000 youth. Part I violent crimes, defined across jurisdictions by the FBI for consistent reporting purposes, include murder, negligent manslaughter, forcible rape, robbery, aggravated assault, burglary, larceny, and motor vehicle theft. Arrest reports are made when law enforcement officers actually take an individual into custody and charge that individual with a crime.

Significance: Arrests of youthful violent offenders is a measure of antisocial and self-destructive behavior. This measure is an indicator of more severe dysfunction than arrests for non-violent crime.

Source: New York State Division of Criminal Justice Services, Uniform Crime Reporting System
Findings: The number of youth younger than age 18 arrested for Part I violent crimes in Erie County was $27 \%$ lower in 2000 than in 1995 ( 371 arrests vs. 506 arrests). Youth arrests in the comparison region also declined during the same period, though the reduction was slightly less at $22 \%$. However, Erie County's youth arrest rates for violent crime have consistently been above NYS excluding NYC rates, with the gap between the two regions growing in recent years. Data are presented in Appendix Table 23.

Caveats: Many reported crimes do not result in an arrest. Arrest rates can be affected by such things as changes in law enforcement policies and staffing patterns. Data reflect the number of arrests, and some youth are arrested more than once within a year, so these arrest rates may somewhat overstate the actual number of youth arrested. Arrests are recorded where they occur and do not necessarily reflect the youth's residence.

## Indicator 5.7: Youth Arrests for Part I Property Crimes

Definition: The number of arrests of persons under age 18, for Part I property crimes, expressed as a rate per 10,000 population under age 18 . Part I property crimes, defined for consistent reporting purposes across jurisdictions by the FBI, include burglary, larceny, and motor vehicle theft. Arrest reports are made when law enforcement officers actually take an individual into custody and charge that individual with a crime.

Significance: This measure is an indicator of youth engaging in unacceptable and illegal behavior.

Source: New York State Division of Criminal Justice Services, Uniform Crime Reporting System
Findings: The number of youth younger than age 18 arrested for Part I property crimes in Erie County was $28 \%$ lower ( 496 fewer arrests) in 2000 than in 1995. The comparison region as a whole experienced a steady decline in the overall number of youth arrests for Part I property crimes, though the NYS excluding NYC rate has historically been between 10 and 20 arrests per 10,000 population higher (i.e. worse) than the Erie County rate over the six-year timeframe. Data are presented in Appendix Table 23.

Caveats: Many reported crimes do not result in an arrest. Arrest rates may be affected by such things as changes in law enforcement policies and staffing patterns. Data reflect the number of arrests, and some individuals may be arrested more than once during a single year, so the arrest rates presented here may overstate the actual number of individuals arrested. Arrests are recorded where they occur, and do not necessarily reflect the individual's residence.

## Indicator 5.8: Youth Morbidity - Gonorrhea

Definition: Reported cases of gonorrhea expressed as a rate per 1,000 youth age $10-19$.
Significance: The Centers for Disease Control and Prevention report that while sexually transmitted diseases (STDs) such as gonorrhea are preventable, they remain an oftenunrecognized public health problem. STDs are known to cause reproductive health problems, including infertility, and also affect perinatal health. Behavioral interventions may reduce the spread of STDs. The Healthy People 2010 Target is no more than 19 new cases of gonorrhea per 100,000 total population.

Findings: Erie County's youth gonorrhea rate was significantly higher than the NYS excluding NYC rate from 1995 to 1999, though since 1995, the number of reported cases of gonorrhea in the County has decreased $39 \%$. Despite the decrease, a substantial number (449) of cases of gonorrhea were reported in 1999. Data are presented in Appendix Table 24.

Caveats: None.

## Indicator 5.9: Youth Using Alcohol, Tobacco, and Other Drugs

Definition: Data for this indicator are taken from the Survey of Alcohol, Tobacco and Drug Use Among Ninth Grade Students, 2000-01, conducted by the Department of Cancer Prevention, Epidemiology, and Biostatistics at Roswell Park Cancer Institute. During the 2000-01 school year, $45 \%$ of ninth grade students in Erie County were surveyed, and the results presented here reflect the actual selfreported prevalence of various behaviors. Survey results from prior years (1992 and 1996) are also presented. For further information on methodology, participation rates, demographic profile, and detailed analyses and findings, see Roswell Park Cancer Institute's Survey of Alcobol, Tobacco and Drug Use Among Ninth Grade Students, 2000-01 report.

Significance: Youth who engage in a variety of risk behaviors, including alcohol and illegal drug abuse or use, may be more likely than their peers to experience negative physical, emotional, behavioral, and social outcomes. In some situations, youth who engage in risk-taking behavior put not only themselves at risk, but may in fact be putting the health and well-being of others at risk as well.

Findings: In 2000, slightly more than a third of $9^{\text {th }}$ graders responding to the survey reported ever being drunk in their lifetime; $29 \%$ reported being drunk within the past 30 days. Between 1992 and 2000, the proportion of students who reported being drunk within the past 30 days increased from $19 \%$, or nearly one in five respondents, to $29 \%$, or almost one in three respondents. The proportion of students reporting use of cigarettes within the past 30 days declined by nearly one third between 1996 and 2000. Still, nearly one in five students reported past 30-day cigarette use in 2000. Additionally, in 2000 nearly $25 \%$ of students reported ever using marijuana, $5 \%$ ever using cocaine, and $9 \%$ ever using other illegal drugs. Data for this measure are presented in Appendix Table 25.

Caveats: Data for this indicator are based on self-reporting and therefore may understate true alcohol and substance use among this population.

## Data Agenda

While the Council on Children and Families identified the following indicators for inclusion in this baseline report under the outcome of Youth Making Wise Decisions, CGR determined that reliable and consistent local trend data are currently unavailable.

# Children Identifying a Meaningful Caring Relationship with At Least One Adult/Positive Role Model ${ }^{1}$ 

## Number of Developmental Assets Reported by Youth ${ }^{2}$

[^10]Outcome Six:

## NURTURING <br> \& STABLE FAMILIES

## Outcome Six: Nurturing and Stable Families

Indicators:

### 6.1 Reported Cases of Domestic Violence

6.2 Reported and Indicated Cases of Child Abuse and Neglect
6.3 Children in Foster Care
6.4 Children Discharged to Adoption
6.5 Length of Time to Achieve Adoption
6.6 Teen Pregnancy Rates, Age 15-19

## Indicator 6.1: Reported Cases of Domestic Violence

Definition: The number of domestic violence incidents reported to law enforcement, regardless of whether a formal complaint was filed or an arrest made. This measure is expressed as a rate per 10,000 population.

Significance: While both males and females are victims of domestic violence, the Centers for Disease Control and Prevention report that females are more likely to be victims than males. The CDC also reports that physically violent male partners are more likely to commit violence against children. There is a known correlation between being abused or witnessing abuse as a child and becoming an abuser as an adult. Nationally, two areas of increasing concern are abuse during pregnancy and teen dating violence.

Findings: Following a three-year decline from 1997 to 1999, domestic violence rates in Erie County increased by $44 \%$ between 1999 and 2000. In 2000, 2,437 reports of domestic violence incidents were made to law enforcement agencies within Erie County, representing the highest number of reports during the six-year study period. During the same period, the larger comparison region's annual rate steadily increased and was consistently substantially higher than the County's rate. By 2000, the NYS excluding NYC rate was more than twice the Erie County rate. Data are presented in Appendix Table 26.

Caveats: For a variety of reasons, not all victims report abuse to law enforcement officers; therefore, reports of domestic violence to law enforcement understate the actual occurrence of acts of domestic violence. Reporting may also be influenced by factors such as education, outreach, and media publicity.

## Indicator 6.2: Reported and Indicated Cases of Child Abuse and Neglect

Definition: The number of reports received and the number of indicated (i.e., substantiated) Child Protective Service reports expressed as a rate per 1,000 children under age 18. Reports are indicated as abused, neglected, or maltreated when a parent or legal guardian is determined to have inflicted, created, and/or committed physical injury or a sex offense that caused or created substantial risk of death, serious or protracted disfigurement, impairment to physical or emotional health, or loss or impairment of any bodily organ. Reports of abuse and neglect are registered with the State Central Register, then investigated by the county and determined to be indicated or unfounded.

Significance: Children who have been abused or neglected are likely to experience long term psychological and emotional/behavioral consequences. Victims of abuse are also at higher risk of abusing their own children when they become parents.

Findings: Between 1995 and 2000, the child abuse and neglect reporting rate had been relatively stable in Erie County, with the annual rate ranging from 33.2 to 34.1 per 1,000 population under age 18. In 2001, the number of reports increased $15 \%$ over the previous year to 9,020 , or 39.1 per 1,000 population under 18 . The indication rate per 1,000 children younger than age 18 peaked at 10.5 per 1,000 in 1998 , and was 9.8 per 1,000 in 2001 . These data reveal that on an annual basis, more than one quarter of all reports of abuse or neglect received are indicated. Erie County's indication rate per 1,000 children less than age 18 has been comparable to the NYS excluding NYC rate. Data are presented in Appendix Table 27.

Caveats: The number of initial reports of abuse or neglect may be influenced by many factors such as outreach, education, and media publicity. An indicated report or case may contain more than one child (e.g., siblings); therefore, the numbers and rates presented here may understate the number of individual children abused or neglected. Additionally, it is unknown how many cases of abuse or neglect are never reported to authorities.

## Indicator 6.3: Children in Foster Care

Definition: The number of children and youth under age 22 in the care and custody of the Commissioner of the local Department of Social Services. These youth may be cared for in congregate care facilities, foster boarding homes, approved relative homes, other facilities such as a Supervised Independent Living Program, or any combination thereof. Children in care is defined as the total number of children in foster care on December 31 of each year, expressed as a rate per 1,000 children under 22 . CGR has calculated these rates using population data from the 2000 Census. ${ }^{1}$

Significance: Children may be placed in foster care when their families are unable to care for them, for safety reasons, or when specialized care or treatment is needed. Many counties are looking for opportunities to reduce costly out-of-home placements by delivering services that will meet the needs of children and their families while the child remains in the home.

Findings: In 2001, the foster care rate in Erie County was 5.3 per 1,000 population under age 22, or 1,477 children, compared to 8.5 per 1,000 in 1995 ( 2,384 children). This reflects a $38 \%$ decline in the number of children in care. Between 1995 and 2001, children in Erie County typically experienced foster care placement more frequently than children in the NYS excluding NYC region. However, that gap has narrowed in recent years. Appendix Tables 28A and 28B provide breakdowns of children in care and children admitted to care each year, respectively.

Caveats: Capacity limitations or cost reduction policies may affect placement decisions and therefore placement rates.

[^11]
## Indicator 6.4: Children Discharged to Adoption

Definition: The number of children in foster care who are discharged to adoption during the calendar year, expressed as a percentage of children in foster care at any time during the calendar year who had a goal of adoption and who had been freed for adoption.

Significance: This is a measure of the County's effectiveness in meeting its adoption goals.

Source: New York State Office of Children and Family Services
Findings: From 1995 to 2001 the proportion of children in foster care in Erie County who were discharged to adoption more than doubled. In 1995, 123, or $17.7 \%$ of children freed for adoption were discharged to adoption. By 2001, 245 children, or $39.8 \%$ of those freed were discharged to adoption. During the period from 1995 to 1999, Erie County was discharging a smaller proportion of children to adoption than the NYS excluding NYC region. Following several years of substantial increases, beginning in year 2000, Erie County's discharge rate was higher (i.e., better) than the larger region's rate, and remained so in 2001. Additional data are needed to determine whether this represents a sustained pattern. Data for this measure (including annual data on children in foster care who have a goal of adoption and children freed for adoption) are presented in Appendix Table 29.

Caveats: None.

## Indicator 6.5: Length of Time to Achieve Adoption

Definition: For children discharged to adoption in a given year, the length of time between establishment of a goal of adoption and actual discharge to adoption.

Significance: Shortening the length of time to achieve adoption is better for the child and is one of the goals of the federal Adoption and Safe Families Act (ASFA). ASFA established a 24 month timeline to achieve permanency for a child who has been removed from the home. Longer placements are also more costly to the state and county because the child remains in the care and custody of the local Social Services Commissioner until he or she is discharged to adoption.

Findings: As shown in Appendix Table 30, Erie County discharged 157\% more children to

Source: New York State Office of Children and Family Services

CGR

Source: New York State Office of Children and Family Services
adoption in 2000 than in 1995 ( 316 vs. 123), and although the number of children discharged to adoption declined to 245 in 2001, this number still represents almost twice as many discharges compared to six years earlier. While more children have been discharged to adoption in recent years, for each of the study years, fewer than half of the adoptions occurred in less than two years from the time that the goal of adoption was set. Compared to the NYS excluding NYC region, Erie County's length of time to achieve adoptions is typically longer than (i.e., worse ) the larger region's.

Caveats: The above information reflects current ability to measure length of time to achieve adoption.

## Indicator 6.6: Teen Pregnancy Rates, Age 15-19

Definition: Number of pregnancies per 1,000 females ages 15-19.
Significance: Babies born to adolescents, particularly younger adolescents, are at higher risk of low birth weight and infant mortality compared to babies born to older mothers. Children of adolescent mothers are at increased risk of lower cognitive development and poor educational outcomes; they are more likely to live in poverty and to have children during adolescence themselves. Adolescent mothers are less likely to complete high school or obtain post secondary education than their peers, a fact which may reduce their employment opportunities and earnings potential. Healthy People 2010 has set a target of zero pregnancies among females under the age of 15 .

Findings: Erie County's teen pregnancy rate has steadily decreased since 1995. In 2000, the most recent year for which data are available, there were 2,077 pregnancies among 15-19 year olds, or $16 \%$ fewer when compared to 1995 . The comparison region has reflected similar downward trends, though to a slightly lesser extent, with $13 \%$ fewer teen pregnancies in 2000 compared to 1995. However, a substantial gap remains between Erie County's and NYS excluding NYC rates, with a significantly higher proportion of Erie County's adolescent females having experienced a pregnancy. Data are presented in Appendix Table 31.

Caveats: These data reflect teen pregnancy rates. Actual birth rates among this population are likely to be lower.

## Data Agenda

While the Council on Children and Families identified the following indicator for inclusion in this baseline report under the outcome of Nurturing and Stable Families, CGR determined that reliable and consistent local trend data are currently unavailable.

Affordable, Accessible, Quality Child Care

Outcome Seven:

## FAMILIES WITH Adequate INCOME

## Outcome Seven: Families With Adequate Income

## Indicators:

### 7.1 Children Living in Poverty

7.2 Population on Temporary Assistance
7.3 Non-Public Assistance Food Stamp Caseload
7.4 Rate of Job Growth

## Indicator 7.1: Children Living in Poverty

Definition: The number of children living in families whose income falls below the Federal poverty level, expressed as a rate per 1,000 children under age 18. Poverty thresholds are adjusted each year for changes in the cost of living. In 1999, the federal poverty level for a family of four was $\$ 17,029$.

Significance: Children living in poverty are at greater risk for poor social, health, and educational outcomes.

Findings: Child poverty in Erie County declined only slightly between 1989 and 1999 (1.6\%), with nearly 40,000 children under age 18 , or $18.3 \%$ of all children in the County, living in poverty in 1999. Conversely, the NYS excluding NYC region experienced a $13.7 \%$ increase in the number of children living in poverty from 1989 to 1999. Despite increasing rates, the comparison region has remained substantially below (better than) Erie County. Appendix Table 32 provides data broken down by the following age groups: children ( $0-17$ years), adults ( $18-64$ years) and seniors (65+ years).

Caveats: For this indicator, CGR determined the 1990 and 2000 Census data (covering years 1989 and 1999) to be the more reliable data source, and therefore have not included poverty estimates for the interim years.

## Indicator 7.2: Population on Temporary Assistance

Definition: Monthly average number of cases and persons receiving income maintenance assistance - Temporary Assistance to Needy Families (TANF) - including Family Assistance and Safety Net, expressed as a rate per 1,000 population under age 65 .

Significance: This measures represents the number of individuals who are dependent upon government support for their basic economic needs.

Findings: Between 1997 and 2001, the number of public assistance cases in Erie County decreased by $45 \%$, and the number of persons receiving public assistance saw a $46 \%$ reduction. The NYS excluding NYC region as a whole experienced a $43 \%$ caseload reduction. Data Table 33 presents caseload data for both Family Assistance and Safety Net, as well as the larger comparison region.

Caveats: December 2001 was the first month in which TANF cases in New York State began exceeding the 60 -month limit on federally funded cash assistance and were transferred from federally funded assistance categories (Family Assistance) to assistance categories funded entirely by state and local dollars (Safety Net). This policy shift may affect caseloads and caseload distribution between categories of temporary assistance in the future.

## Indicator 7.3: Non-Public Assistance Food Stamp Caseload

Definition: Monthly households and persons who do not receive financial assistance/income maintenance (TANF or Safety Net) but who qualify for and receive food stamp benefits, expressed as a rate per 1,000 population.

Significance: Non-Public Assistance (non-PA) food stamp recipients represent those not on public assistance but whose income level is still significantly low as indicated by their eligibility for food stamps. This indicator, therefore, serves as a proxy for identifying the number of working poor households and families.

Findings: The number of Erie County households and individuals not on public assistance who receive food stamps has remained relatively stable since 1995. It is too early to tell whether the increase in individuals receiving food stamps between 2000 and 2001 represents the beginning of an upward trend. Erie County's non-PA food stamp rate has historically been substantially higher than the NYS excluding NYC rate. Data are presented in Appendix Table 34.

Caveats: This indicator may not measure all of the working poor. For example, there are those who are income eligible but who do not apply for food stamps, as well as those whose incomes just exceed eligibility requirements but nevertheless are still working poor.

## Indicator 7.4: Rate of Job Growth

Definition: The net number of new jobs created is calculated from annual average employment data. This measure represents the growth in new jobs, expressed as the percentage change in the total number of jobs.

Significance: Job growth is a key indicator of economic health and reveals how much an economy is expanding.

Source: New York State Department of Labor
Findings: While the Buffalo region has experienced slight year-to-year fluctuations, overall, the number of jobs in the region has remained relatively stable. From 1995 to 2000, the Buffalo region experienced some level of job growth. In 2001 and 2002 the region lost jobs, with the net effect being about 8,700 fewer jobs in the region in 2002 than had existed in 1995. The NYS excluding NYC region has experienced a trend pattern similar to the Buffalo region's, although the larger comparison region lost a smaller proportion of jobs compared to the Buffalo region. Data for this measure are presented in Appendix Table 35.

Caveats: These data include full-time and part-time jobs. The Department of Labor tracks job growth at the MSA level (Metropolitan Statistical Area) rather than at the individual county level. The Buffalo MSA incorporates Erie and Niagara Counties.

## Data Agenda

While the Council on Children and Families identified the following indicator for inclusion in this baseline report under the outcome of Families with Adequate Income, CGR determined that reliable and consistent local trend data are currently unavailable.

Adult and Child Literacy Levels

Outcome Eight:

# SAFE \& <br> SUPPORTIVE COMMUNITIES 

## Outcome Eight: Safe and Supportive Communities

Indicators:
8.1 Reported Part I Violent Crime Rate
8.2 Reported Part I Property Crime Rate
8.3 Drug Arrests (Total Population)
8.4 Labor Force Participation Rate

## Indicator 8.1: Reported Part I Violent Crime Rate

Definition: The number of reported Part I violent crimes per 10,000 population including murder, non-negligent manslaughter, forcible rape, robbery, and aggravated assault. Part I violent crimes are defined by the FBI for consistent reporting purposes across jurisdictions and reported by law enforcement agencies on Uniform Crime Reports.

Significance: Crime statistics are basic indicators of public safety. Crime affects the quality of life of those who directly experience and witness it, but it may also impact the lives of others in a community who may feel threatened by it. Low crime rates may promote connections within the community, housing stability, and a community's attractiveness as a place to live, work, and do business.

Findings: Part I violent crimes have declined significantly in Erie County, and by 1999 the rate was half of what it had been in 1995. However, in 2000, the number of reports increased $9 \%$ to 4,545 , the first increase in five years. It is too soon to determine whether this represents the beginning of an upward trend. Despite the significant reduction between 1995 and 2000, Erie County consistently registers a higher crime rate than the NYS excluding NYC region as a whole. While the gap is narrowing, in 2000, Erie County's violent crime rate was 47.4 per 10,000 compared to 28.4 per 10,000 for the comparison region. Data are presented in Appendix Table 36.

Caveats: Not all Part I crimes are reported to law enforcement; rape, for example, is underreported. Kidnapping and arson numbers are not reflected in these trends although they are considered violent felony offenses in New York State. This is because the FBI considers these Part II crimes for reporting purposes.

## Indicator 8.2: Reported Part I Property Crime Rate

Definition: The number of reported serious, or Part I, property crimes per 10,000 population. Part I property crimes are defined by the FBI for consistent reporting purposes across jurisdictions and include burglary, larceny, and motor vehicle theft.

Significance: Crime statistics are basic indicators of public safety. Crime affects the quality of life of those who directly experience and witness it, but it also impacts the lives of others in a community who may feel threatened by it. Low crime rates may promote connections within the community, housing stability, and a community's attractiveness as a place to live, work and do business.

Source: New York State Division of Criminal Justice Services, Uniform Crime Reporting System
Findings: Erie County showed a $26 \%$ reduction in reported Part I property crimes from 1995 to 2000 ( 41,718 reports in 1995 compared to 30,926 reports in 2000). The comparison region as a whole experienced a similar trend, with reports falling by about $22 \%$, though NYS excluding NYC's rate has consistently been significantly below (i.e., better than) the County's rate. See Appendix Table 36 for breakdowns by violent and property crimes.

Caveats: Not all Part I property crimes that occur are reported to the police. For example, burglary and motor vehicle theft tend to be reported more frequently than other property crimes due to insurance claim issues.

## Indicator 8.3: Drug Arrests (Total Population)

Definition: The number of arrests of persons of all ages for drug related offenses, expressed as a rate per 10,000 population.

Significance: Drug use and other illegal drug related activity can have immediate as well as long term negative health, social, and economic consequences.

Source: NYS Division of Criminal Justice Services, Uniform Crime Reporting System
Findings: After peaking in 1997 (5,909 arrests), the number of drug arrests in Erie County decreased by approximately $26 \%$ to 4,362 arrests in 2000. From 1995 to 1997, both Erie County's rate and the larger comparison area's rate increased, though the County's rate of increase was greater than region's. However, in 1998 the County's rate fell below that of the NYS excluding NYC region, and has been below (i.e., better than) the comparison rate since that time. In fact, while Erie County's rates dropped substantially at the end of the decade, NYS excluding NYC drug arrest rates continued to rise. Data for this measure, with breakdowns by age, are presented in Appendix Table 18.

Caveats: Arrest rates may be affected by increased or decreased surveillance by law enforcement agencies, or they may reflect actual increases or decreases in the prevalence of drug sales or use. Data reflect the number of arrests, and some individuals may be arrested more than once during a single year, so the arrest rates presented here may overstate the actual number of individuals arrested. Arrests are recorded where they occur, and do not necessarily reflect the individual's residence.

## Indicator 8.4: Labor Force Participation Rate

Definition: This index is calculated by dividing the total number or persons employed or looking for work (unemployed) by the total labor pool (persons age 16 or older who are not institutionalized).

Significance: The labor force participation rate is an important measure of individuals' willingness to work outside the home. During the latter half of the $20^{\text {th }}$ century, women's labor force participation rates soared. In its The State of America's Children Yearbook 2001, the Children's Defense Fund reports that three in five preschoolers have their mother in the labor force.

Findings: Throughout the seven-year period between 1995 and 2001, the labor force participation rate in Erie County varied between $59.3 \%$ and $63.8 \%$. Since 1997, the County's rates have exhibited a slight but steady downward trend. The County has typically been between 1.5 and 3 percentage points below the rate for the comparison region as a whole. Data for this indicator are presented in Appendix Table 37.

Caveats: This measure does not provide estimates of underemployment, nor does it account for discouraged workers who are no longer actively seeking employment. 2001 rate calculations are based on 2000 Census population data; 2001 county level population estimates are not yet available.

## Data Agenda

While the Council on Children and Families identified the following indicators for inclusion in this baseline report under the outcome of Safe and Supportive Communities, CGR determined that reliable and consistent local trend data are currently unavailable.

## Commercial Occupancy Rates

Number of Communities that Provide Needed Human and Material Resources
Number of Communities with Block Clubs

Number of Communities that Provide Activities to Promote Connections/Engagement
Emergency Response Time of Five Minutes or Less
Safe, Affordable and Accessible Housing
Rates of Sexual Abuse

## Section IV

[^0]:    ${ }^{1}$ CGR has adapted its starting list of community outcomes and its process for selecting indicators from the work of the Fiscal Policy Studies Institute and the Center for the Study of Social Policy.

[^1]:    Source: U.S. Census Bureau

[^2]:    ${ }^{2}$ The Census defines a family as: "A group of two or more people who reside together and who are related by birth, marriage, or adoption."
    ${ }^{3}$ In this discussion and the figures, the following definitions apply: "Married with children" are families with a married householder and at least one related child under the age of 18. "Married, no children" are families with a married householder and no related children under the age of 18. "Single parents with children," as used above, is actually a compilation of two different types of Census families with children: Male householder, no wife present, with related children under 18 years, and Female householder, no husband present, with own children under 18 years. Therefore, although these include single parent families, they could also include grandparents/grandchild families, or other family combinations with an unmarried head of household and at least one related child. "Not married, no children" includes any variation of relatives living together not otherwise categorized above, i.e., a grown child living with an unmarried parent, cousins or siblings sharing a household, etc.

[^3]:    Source: U.S. Census Bureau

[^4]:    ${ }^{4}$ The Census added a category of "two or more races" in 2000, making a comparison between 1990 and 2000 difficult.

[^5]:    ${ }^{5}$ Due to the nature of median income and per capita income, both calculated by the U.S. Census Bureau, it is not possible to calculate a number for the Rest of County, so these comparisons are between the City and the County as a whole. Household income groupings, however, have been calculated for the Rest of County.
    ${ }^{6}$ The appendix shows that median household income and per capita income, both of which can be adjusted for inflation, did indeed grow much faster in the County as a whole than in the City of Buffalo. See data appendix for more details.

[^6]:    ${ }^{7}$ Following the Office of Management and Budget's (OMB's) Directive 14, the Census Bureau uses a set of money income thresholds that vary by family size and composition to detect who is poor. If the total income for a family or unrelated individual falls below the relevant poverty threshold, then the family or unrelated individual is classified as being "below the poverty level."

[^7]:    ${ }^{1}$ The assumption is that participation in quality early care, Early Intervention, and preschool services will reduce the future need for special education services once a child reaches school age. Indicator 2.4 is therefore included under this outcome to assist with future tracking of this relationship.

[^8]:    ${ }^{1}$ Erie County expects to contract with the Search Institute to conduct a countywide survey of developmental assets among $8^{\text {th }}$ and $11^{\text {th }}$ graders in the spring of 2003.

[^9]:    ${ }^{1}$ See Indicator 5.9 for available data on prevalence estimates among ninth graders.
    ${ }^{2}$ See Indicator 5.9 for available data on prevalence estimates among ninth graders.
    ${ }^{3}$ In 1999, Erie County's Public Health Coalition conducted a Health Risk. Assessment Survey. 10.3\% of survey respondents reported that they were uninsured. $5.9 \%$ of respondents indicated that they had no regular source of care. 1999 is the only year for which these data were collected, and the Public Health Coalition does not anticipate administering the survey in the future.

[^10]:    ${ }^{1}$ Erie County expects to contract with the Search Institute to conduct a countywide survey of developmental assets among 8th and 11th graders in the spring of 2003.
    ${ }^{2}$ Erie County expects to contract with the Search Institute to conduct a countywide survey of developmental assets among 8th and 11th graders in the spring of 2003.

[^11]:    ${ }^{1}$ Prior to 2000 , OCFS used population estimates that included children under age 18 in its rate calculations for the number of children admitted to and in foster care. Beginning with 2000 data, OCFS changed the manner in which it calculated rates to use 2000 Census population figures for children under age 22. To allow for reliable comparisons, CGR recalculated the 1995 through 1999 rates using OCFS' updated methodology.

[^12]:    * Two or more races from 2000 Census only
